

Requirements

The implementation of a concurrency control algorithm (chosen from those discussed during the course). You may develop a simplified project that meets the following conditions:

- a. The application must be distributed, following a multi-tier client–server architecture (e.g., client/web layer – business or middleware layer – data layer).
- b. The application must use at least one database (not necessarily a relational database).
- c. The application must implement at least 6–8 operations or use cases.
